Course 2: Basic Technologies

Part III: Synchrotron Sources / FEL

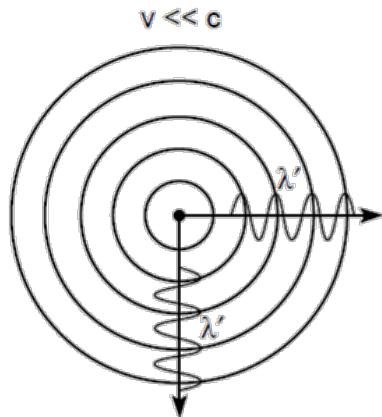

Synchrotron Radiation

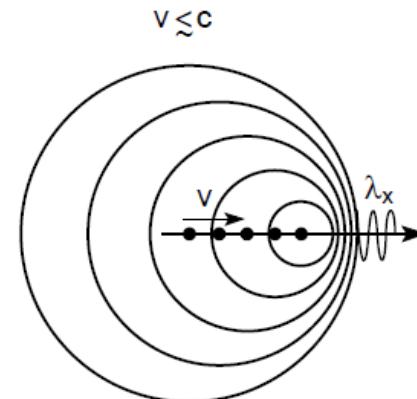

Facts and figures

- Ring accelerator for electrons and positrons
- Length: 2304 metres
- Commissioning: 1978
- 1978-1986: particle physics
- 1987-2007: pre-accelerator for HERA and X-ray radiation source
- Since 2009: most brilliant storage-ring-based X-ray source in the world
- Start of user operation: 2009
- 14 experimental stations with up to 30 instruments

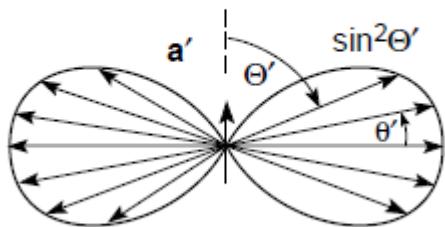

relativistic electrons

Frame moving with electron

Laboratory frame of reference

$$\lambda = \lambda' \left(1 - \frac{v}{c} \cos\theta\right)$$

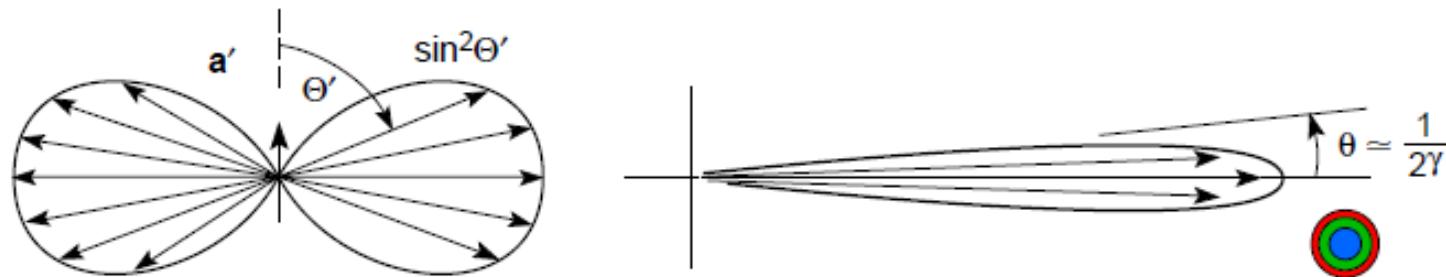

$$\lambda = \lambda' \gamma \left(1 - \frac{v}{c} \cos\theta\right)$$

$$\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$$

$$\tan\theta = \frac{\sin\theta'}{\gamma(\beta + \cos\theta')}$$

Relativistic Electrons Radiate in a Narrow Forward Cone

Dipole radiation

Frame of reference
moving with electrons

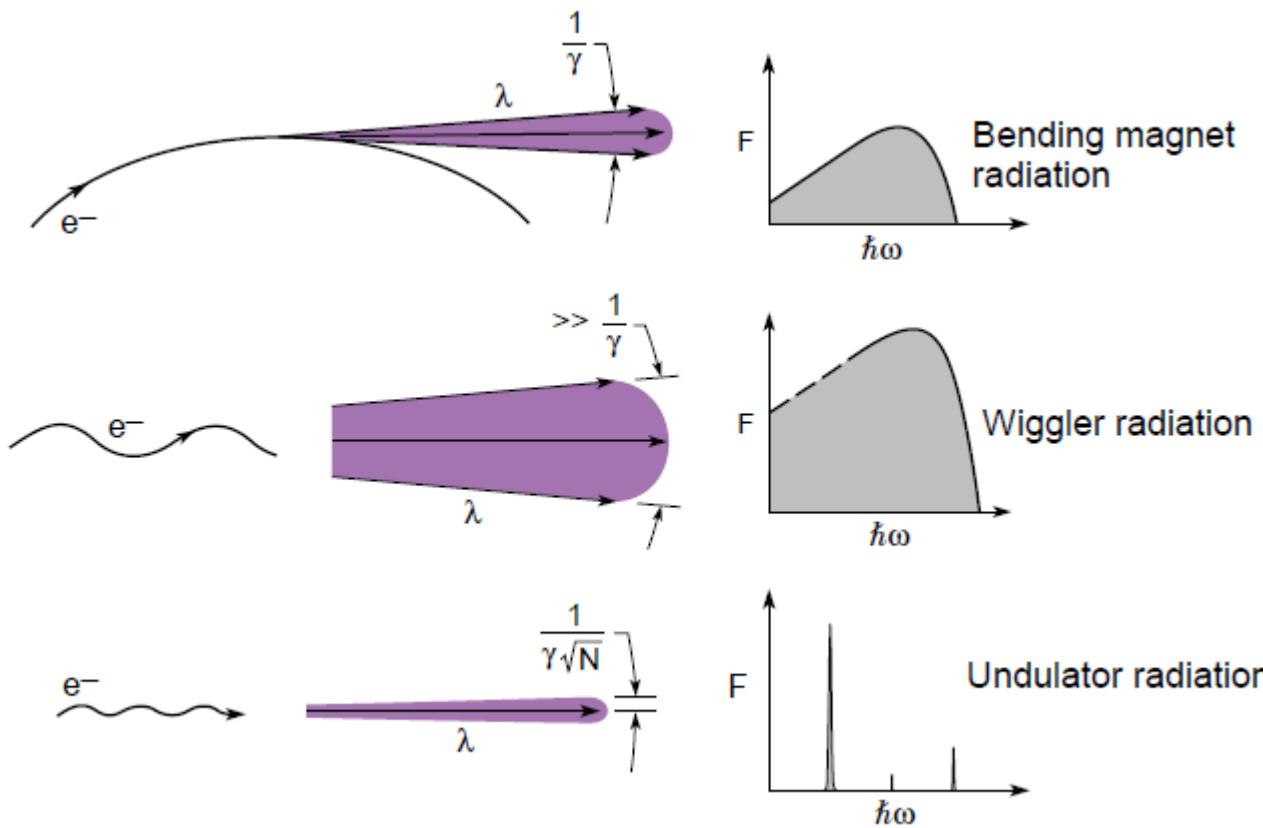

$$\begin{array}{c}
 \begin{array}{c}
 \text{Diagram showing } \mathbf{k}' \text{ at an angle } \theta' \text{ to the } k'_z \text{ axis.} \\
 \mathbf{k}' = 2\pi/\lambda'
 \end{array}
 & \xrightarrow{\text{Lorentz transformation}} &
 \begin{array}{c}
 \text{Diagram showing } \mathbf{k} \text{ at an angle } \theta \text{ to the } k_z \text{ axis.} \\
 \mathbf{k}'_x = k_x
 \end{array}
 \end{array}$$

Laboratory frame of reference

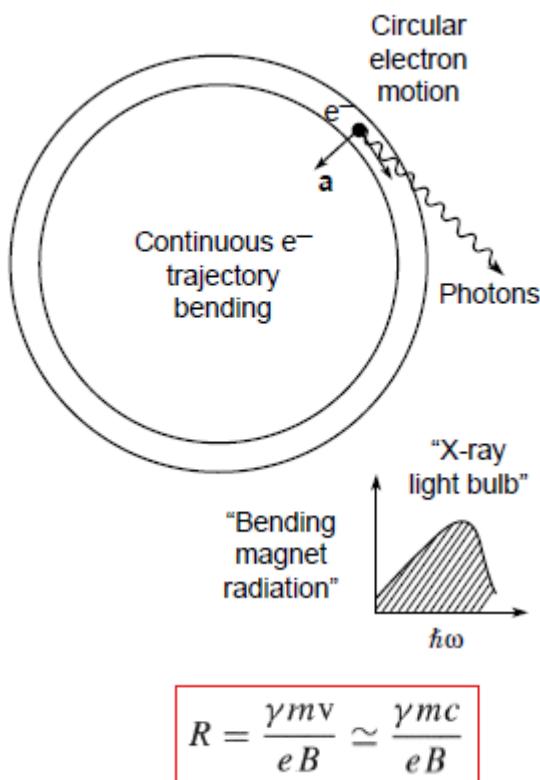

$$k_z = 2\gamma k'_z \text{(Relativistic Doppler shift)}$$

$$\theta = \frac{k_x}{k_z} \approx \frac{k'_x}{2\gamma k'_z} = \frac{\tan \theta'}{2\gamma} = \frac{1}{2\gamma}$$

Three types of radiation

1. Bending magnet radiation (... „old style“)

The Lorentz force for a relativistic electron in a constant magnetic field is

$$\mathbf{F} = \frac{d\mathbf{p}}{dt} = -e\mathbf{v} \times \mathbf{B}$$

where $\mathbf{p} = \gamma m\mathbf{v}$. In a fixed magnetic field the rate of change of electron energy is

$$\frac{dE_e}{dt} = \mathbf{v} \cdot \mathbf{F} = \underbrace{-e\mathbf{v} \cdot (\mathbf{v} \times \mathbf{B})}_{=0}$$

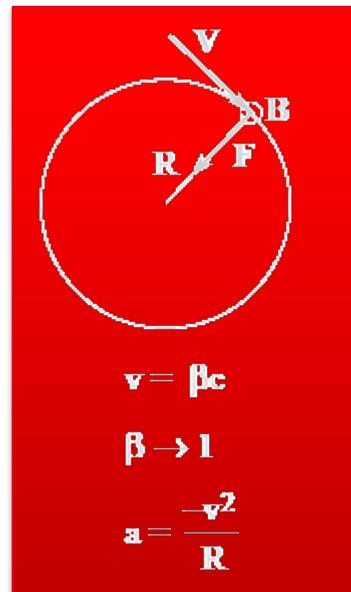

thus with $E_e = \gamma mc^2$

$$\frac{dE_e}{dt} = \frac{d}{dt}(\gamma mc^2) = 0$$

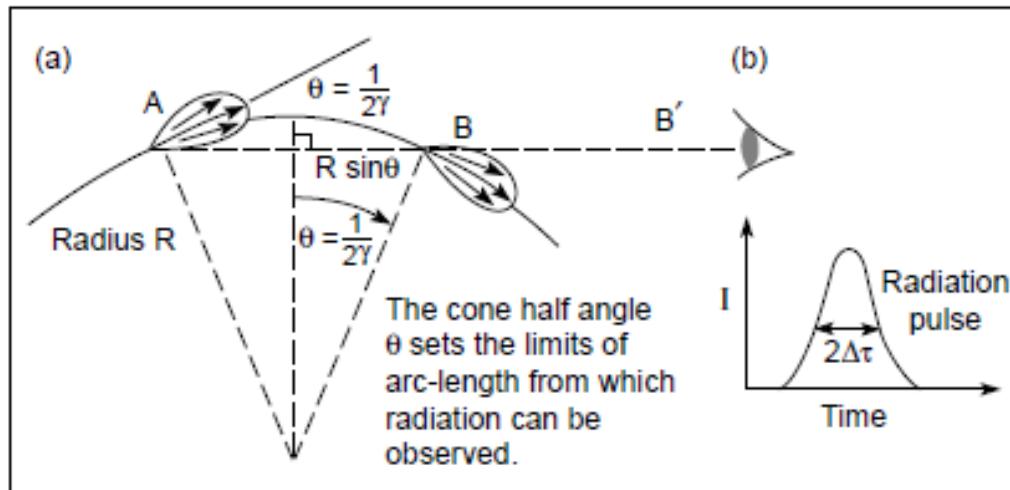

$$\therefore \gamma = \text{constant}$$

and the force equation becomes

$$\begin{aligned} \frac{d\mathbf{p}}{dt} &= \gamma m \frac{d\mathbf{v}}{dt} = -e\mathbf{v} \times \mathbf{B} \\ \gamma m \left(-\frac{\mathbf{v}^2}{R} \right) &= -e\mathbf{v}\mathbf{B} \end{aligned}$$

Bending Magnet Radiation

$$2\Delta\tau = \tau_e - \tau_r$$

$$2\Delta\tau = \frac{\text{arc length}}{v} - \frac{\text{radiation path}}{c}$$

$$2\Delta\tau \simeq \frac{R \cdot 2\theta}{v} - \frac{2R \sin\theta}{c}$$

With $\theta \simeq 1/2\gamma$, $\sin\theta \simeq \theta$

$$2\Delta\tau \simeq \frac{R}{\gamma v} - \frac{R}{\gamma c} = \frac{R}{\gamma} \left(\frac{1}{v} - \frac{1}{c} \right)$$

With $v = \beta c$

$$2\Delta\tau \simeq \frac{R}{\gamma\beta c} (1 - \beta) \quad \text{but} \quad (1 - \beta) \simeq \frac{1}{2\gamma^2} \quad \text{and} \quad R = \frac{\gamma mc}{eB}$$

$$2\Delta\tau = \frac{m}{2eB\gamma^2}$$

Bending magnet radiation revisited

From Heisenberg's Uncertainty Principle for rms pulse duration and photon energy

$$\Delta E \cdot \Delta \tau \geq \hbar/2$$

thus

$$\Delta E \geq \frac{\hbar}{2\Delta\tau}$$

$$\Delta E \geq \frac{\hbar}{m/2eB\gamma^2}$$

Thus the single-sided rms photon energy width (uncertainty) is

$$\Delta E \geq \frac{2e\hbar B\gamma^2}{m}$$

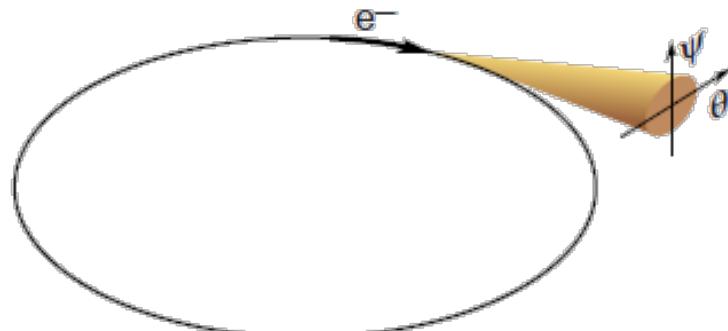

A more detailed description of bending magnet radius finds the critical photon energy

$$E_c = \hbar\omega_c = \frac{3e\hbar B\gamma^2}{2m}$$

In practical units the critical photon energy is

$$E_c(\text{keV}) = 0.6650 E_e^2(\text{GeV}) B(\text{T})$$

bending magnet - summary

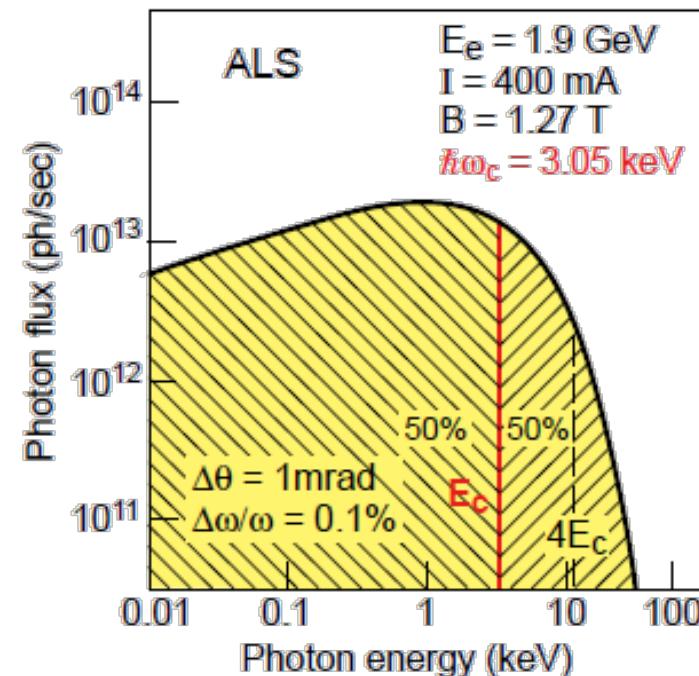

$$E_c = \hbar\omega_c = \frac{3e\hbar B\gamma^2}{2m} \quad (5.7a)$$

$$E_\phi(\text{keV}) = 0.6650 E_e^2 (\text{GeV}) B (\text{T}) \quad (5.7b)$$

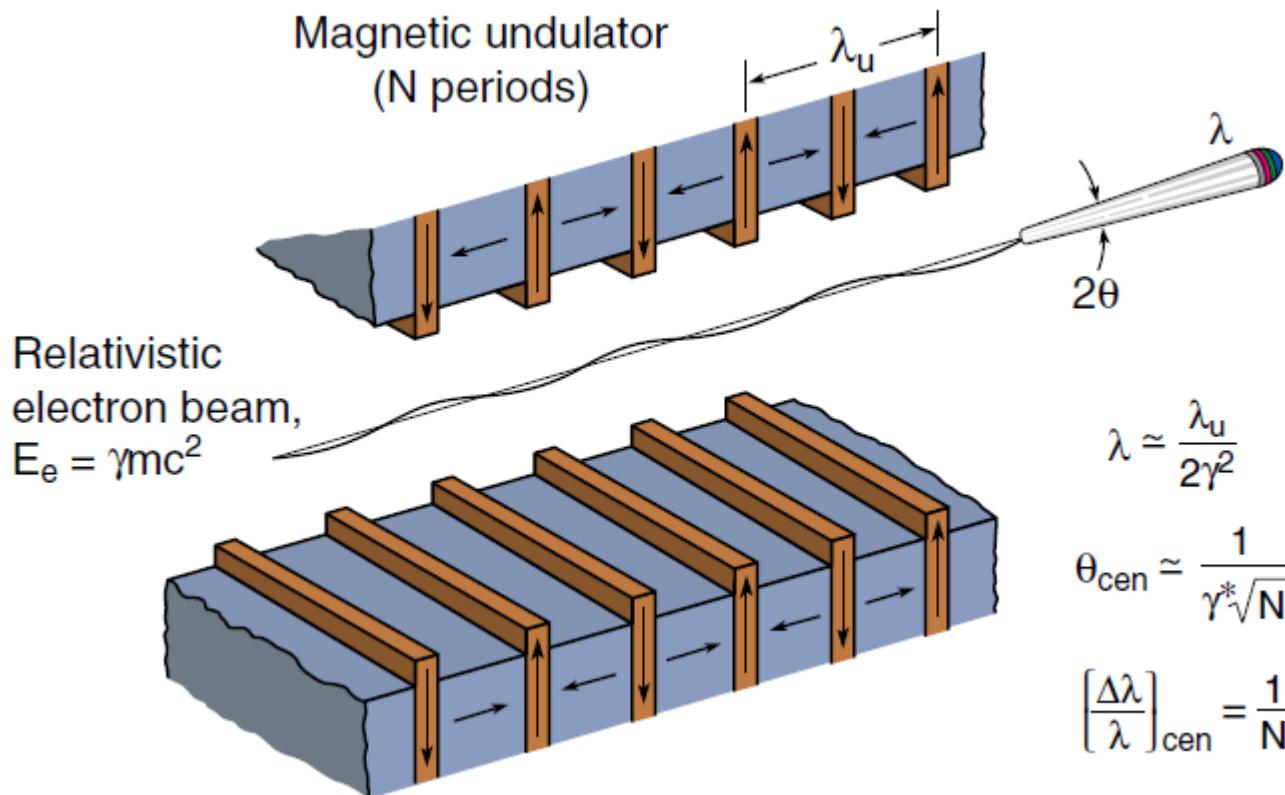

$$\frac{d^2F_B}{d\theta d\omega/\omega} = 2.46 \times 10^{13} E_e (\text{GeV}) I (\text{A}) G_1(E/E_e) \frac{\text{photons/s}}{\text{mrad} \cdot (0.1\% \text{BW})} \quad (5.8)$$

- Advantages:
- covers broad spectral range
 - least expensive
 - most accessible

- Disadvantages:
- limited coverage of hard x-rays
 - not as bright as undulator

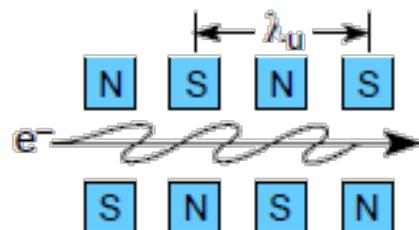

Undulator

undulator radiation

Laboratory Frame of Reference

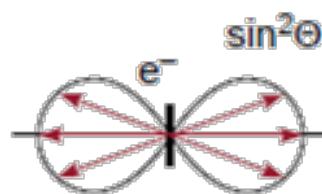

$$E = \gamma mc^2$$

$$\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$$

N = # periods

Frame of moving e-

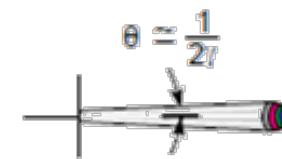

e⁻ radiates at the Lorentz contracted wavelength:

$$\lambda' = \frac{\lambda_u}{\gamma}$$

Bandwidth:

$$\frac{\lambda'}{\Delta \lambda'} = N$$

Frame of observer

Doppler shortened wavelength on axis:

$$\lambda = \lambda' \gamma (1 - \beta \cos \theta)$$

$$\lambda = \frac{\lambda_u}{2\gamma^2} (1 + \gamma^2 \theta^2)$$

Accounting for transverse motion due to the periodic magnetic field:

$$\lambda = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2} + \gamma^2 \theta^2 \right)$$

where $K = eB_0\lambda_u / 2\pi mc$

where does the $\lambda = \lambda_u / 2\gamma^2$ come from?

The electron “sees” a Lorentz contracted period

$$\lambda' = \frac{\lambda_u}{\gamma}$$

and emits radiation in its frame of reference at frequency

$$f' = \frac{c}{\lambda'} = \frac{c\gamma}{\lambda_u}$$

Observed in the laboratory frame of reference, this radiation is Doppler shifted to a frequency

$$f = \frac{f'}{\gamma(1 - \beta \cos \theta)} = \frac{c}{\lambda_u(1 - \beta \cos \theta)}$$

On-axis ($\theta = 0$) the observed frequency is

$$f = \frac{c}{\lambda_u(1 - \beta)}$$

$$f = \frac{c}{\lambda_u(1 - \beta)}$$

By definition $\gamma = \frac{1}{\sqrt{1 - \beta^2}}$; $\gamma^2 = \frac{1}{(1 - \beta)(1 + \beta)} \simeq \frac{1}{2(1 - \beta)}$

thus

$$f = \frac{2\gamma^2 c}{\lambda_u}$$

and the observed wavelength is

$$\lambda = \frac{c}{f} = \frac{\lambda_u}{2\gamma^2}$$

With electrons executing N oscillations as they traverse the periodic magnet structure, and thus radiating a wavetrain of N cycles, it is of interest to know what angular cone contains radiation of relative spectral bandwidth

$$\frac{\Delta\lambda}{\lambda} = \frac{1}{N} \quad (5.14)$$

Write the undulator equation twice, once for on-axis radiation ($\theta = 0$) and once for shifted radiation off-axis at angle θ :

$$\lambda_0 + \Delta\lambda = \frac{\lambda_u}{2\gamma^2} (1 + \gamma^2\theta^2)$$

$$\lambda_0 = \frac{\lambda_u}{2\gamma^2}$$

divide and simplify to

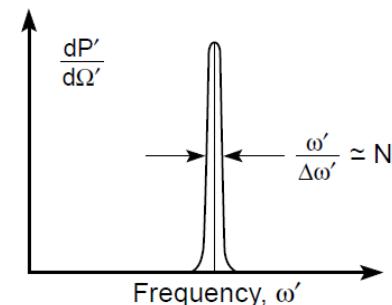

$$\frac{\Delta\lambda}{\lambda} \simeq \gamma^2\theta^2 \quad (5.13)$$

Combining the two equations (5.13 and 5.14)

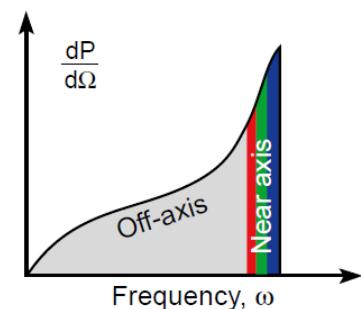

defines θ_{cen} : $\gamma^2\theta_{cen}^2 \equiv \frac{1}{N}$, which gives

$$\theta_{cen} \simeq \frac{1}{\gamma\sqrt{N}} \quad (5.15)$$

This is the half-angle of the “central radiation cone”, defined as containing radiation of $\Delta\lambda/\lambda = 1/N$.

Execution of N electron oscillations produces a transform-limited spectral bandwidth, $\Delta\omega'/\omega' = 1/N$.

The Doppler frequency shift has a strong angle dependence, leading to lower photon energies off-axis.

radiation power of an undulator

$$\lambda_x = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2} + \gamma^2 \theta^2\right)$$

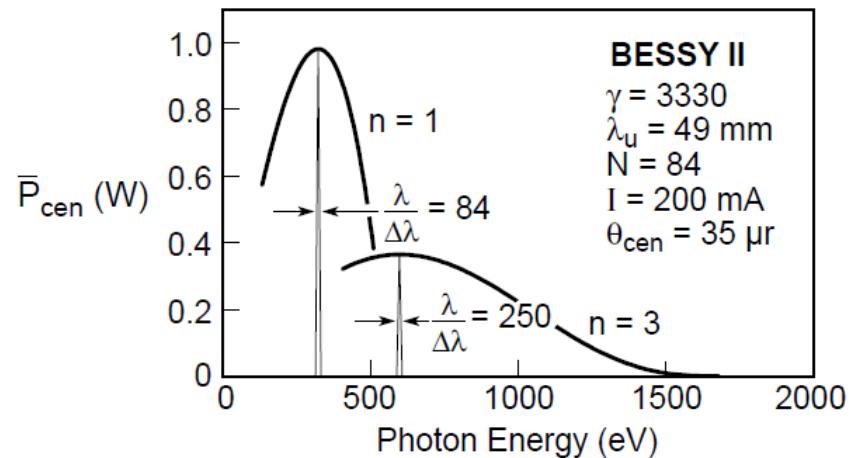

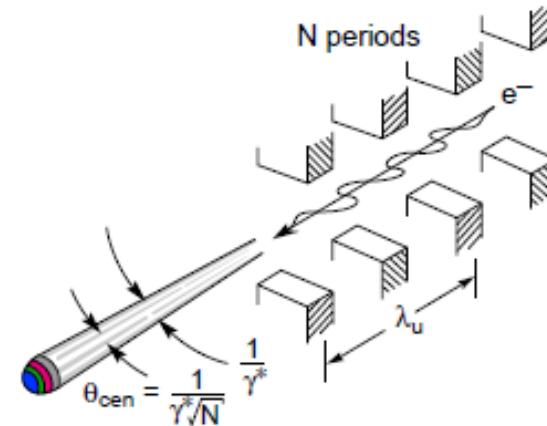

$$\bar{P}_{cen} = \frac{\pi e \gamma^2 I}{\epsilon_0 \lambda_u} \frac{K^2}{(1 + \frac{K^2}{2})^2} f(K)$$

$$\theta_{cen} = \frac{1}{\gamma^* \sqrt{N}}$$

$$\left(\frac{\Delta\lambda}{\lambda}\right)_{cen} = \frac{1}{N}$$

$$K = \frac{e B_0 \lambda_u}{2\pi m_0 c}$$

$$\gamma^* = \gamma / \sqrt{1 + \frac{K^2}{2}}$$

Magnetic fields in the periodic undulator cause the electrons to oscillate and thus radiate. These magnetic fields also slow the electrons axial (z) velocity somewhat, reducing both the Lorentz contraction and the Doppler shift, so that the observed radiation wavelength is not quite so short. The force equation for an electron is

$$\frac{d\mathbf{p}}{dt} = -e(\mathbf{E} + \mathbf{v} \times \mathbf{B})$$

where $\mathbf{p} = \gamma m v$ is the momentum. The radiated fields are relatively weak so that

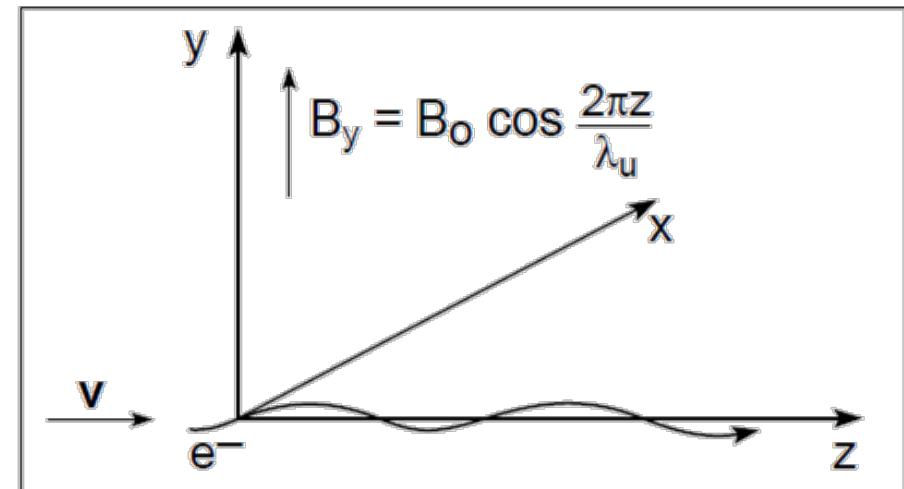

$$\frac{d\mathbf{p}}{dt} \simeq -e(\mathbf{v} \times \mathbf{B})$$

Taking to first order $v \simeq v_z$, motion in the x-direction is

$$m\gamma \frac{dv_x}{dt} = +ev_z B_y$$

$$m\gamma \frac{dv_x}{dt} = e \frac{dz}{dt} \cdot B_0 \cos\left(\frac{2\pi z}{\lambda_u}\right) \quad (0 \leq z \leq N\lambda_u)$$

$$m\gamma dv_x = e dz B_0 \cos\left(\frac{2\pi z}{\lambda_u}\right)$$

$$m\gamma dv_x = e dz B_0 \cos\left(\frac{2\pi z}{\lambda_u}\right)$$

integrating both sides

$$m\gamma v_x = eB_0 \frac{\lambda_u}{2\pi} \int \cos\left(\frac{2\pi z}{\lambda_u}\right) \cdot d\left(\frac{2\pi z}{\lambda_u}\right)$$

$$m\gamma v_x = \frac{eB_0\lambda_u}{2\pi} \sin\left(\frac{2\pi z}{\lambda_u}\right)$$

$$v_x = \frac{Kc}{\gamma} \sin\left(\frac{2\pi z}{\lambda_u}\right)$$

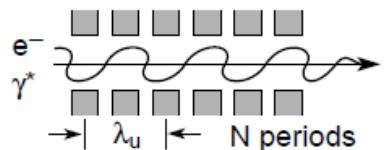

$$K \equiv \frac{eB_0\lambda_u}{2\pi mc} = 0.9337 B_0(T) \lambda_u (\text{cm})$$

is the non-dimensional “magnetic deflection parameter.”
The “deflection angle”, θ , is

$$\theta = \frac{v_x}{v_z} \simeq \frac{v_x}{c} = \frac{K}{\gamma} \sin k_u z$$

calculating the radiation power of the central cone

x, z, t laboratory frame of reference

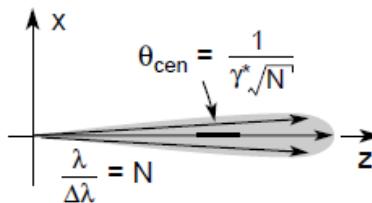

Determine x, z, t motion:

$$\frac{dp}{dt} = -e (\mathbf{E} + \mathbf{v} \times \mathbf{B})$$

$$m\gamma \frac{dv_x}{dt} = e \frac{dz}{dt} B_0 \cos \frac{2\pi z}{\lambda_u}$$

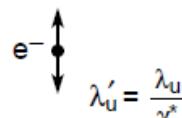

$$v_x(t); a_x(t) = \dots$$

$$v_z(t); a_z(t) = \dots$$

x', z', t' frame of reference moving with the average velocity of the electron

Lorentz transformation

$$\lambda'_u = \frac{\lambda_u}{\gamma'}$$

x', z', t' motion
 $a'(t')$ acceleration

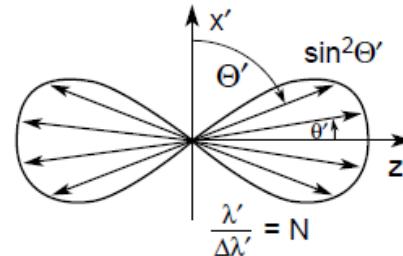

Dipole radiation:

$$\frac{dP'}{d\Omega'} = \frac{e^2 a'^2 \sin^2 \Theta'}{16\pi^2 \epsilon_0 c^3}$$

$$\frac{dP'}{d\Omega'} = \frac{e^2 c \gamma^2}{4\epsilon_0 \lambda_u^2} \frac{K^2}{(1+K^2/2)^2} (1-\sin^2 \theta' \cos^2 \phi') \cos^2 \omega'_u t'$$

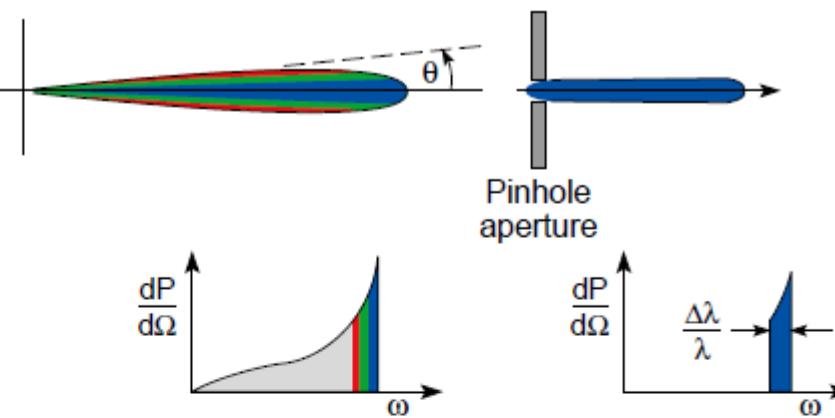

$$\bar{P}_{cen} = \frac{\pi e \gamma^2 I}{\epsilon_0 \lambda_u} \frac{K^2}{(1+K^2/2)^2} f(K)$$

Synchrotron radiation sources

Bending Magnet:

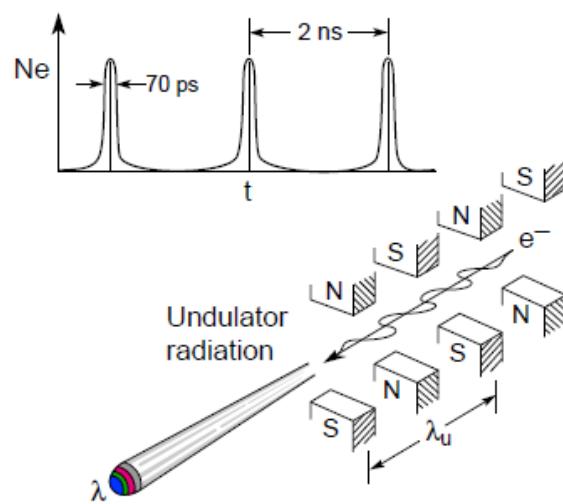

$$\hbar\omega_c = \frac{3e\hbar B\gamma^2}{2m}$$

Wiggler:

$$\hbar\omega_c = \frac{3e\hbar B\gamma^2}{2m}$$

$$n_c = \frac{3K}{4} \left(1 + \frac{K^2}{2} \right)$$

$$P_T = \frac{\pi e K^2 \gamma^2 I N}{3\epsilon_0 \lambda_u}$$

Undulator:

$$\lambda = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2} + \gamma^2 \theta^2 \right)$$

$$K = \frac{eB_0\lambda_u}{2\pi mc}$$

$$\theta_{cen} = \frac{1}{\gamma^* \sqrt{N}}$$

$$\left. \frac{\Delta\lambda}{\lambda} \right|_{cen} = \frac{1}{N}$$

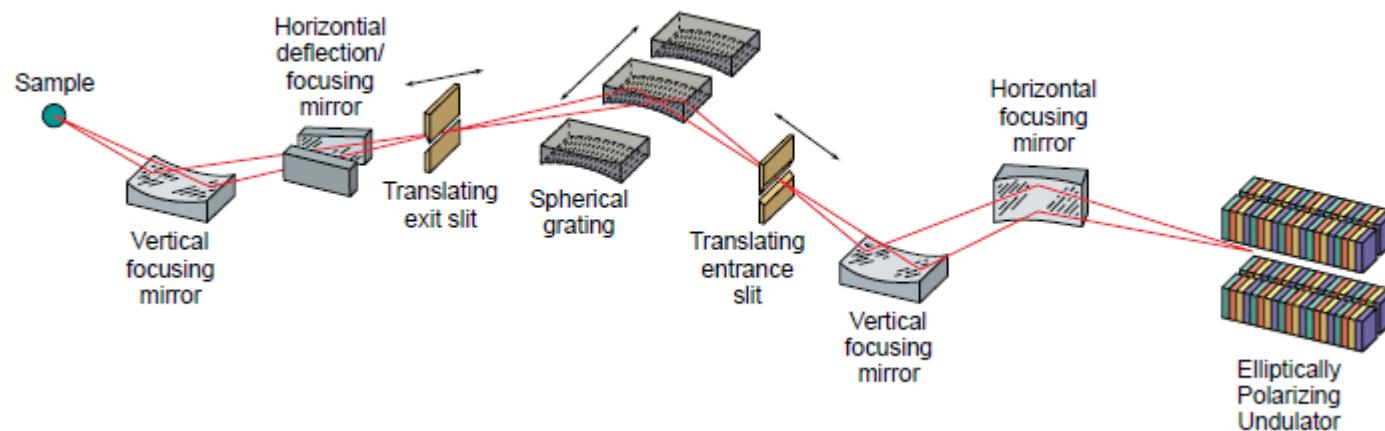

$$\bar{P}_{cen} = \frac{\pi e \gamma^2 I}{\epsilon_0 \lambda_u} \frac{K^2}{\left(1 + \frac{K^2}{2} \right)^2} f(K)$$

For a particle moving at a velocity v with a total energy E

$$E = \gamma m_o c^2$$

with $\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$

short reminder...

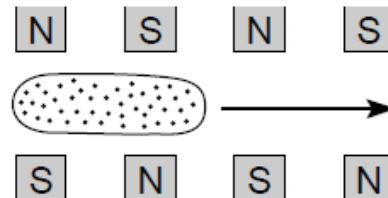

FEL – Free Electron Lasers

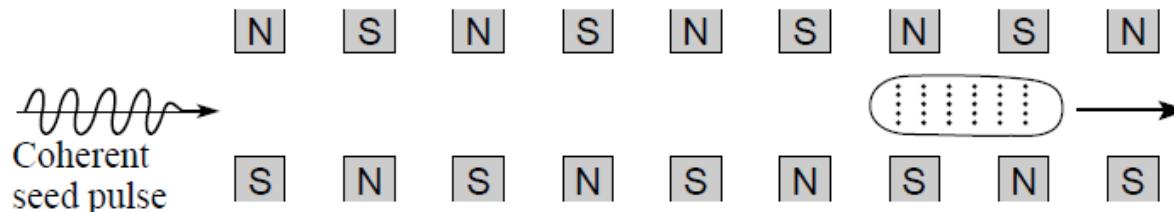

Some Free Electron Lasers

Undulator vs. FEL

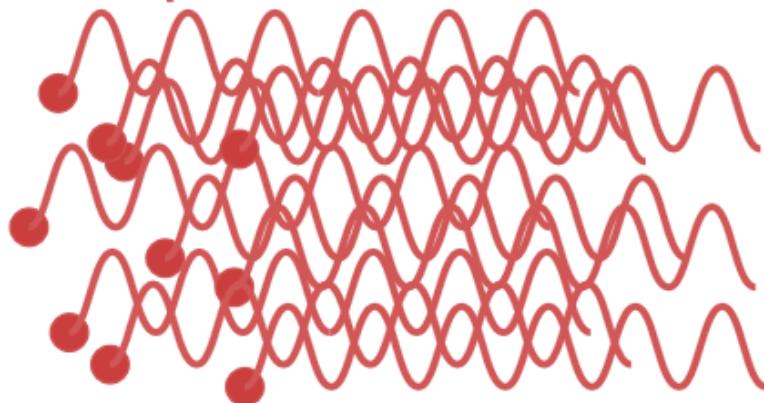

Undulator – uncorrelated electron positions, radiated fields uncorrelated, intensities add, limited coherence, power $\sim N$.

Free Electron Laser (FEL) – very long undulator, electrons are “microbunched” by their own radiated fields into strongly correlated waves of electrons, all radiated electric fields now add, spatially coherent, power $\sim N^2$

SR or ERL

Spontaneous Radiation

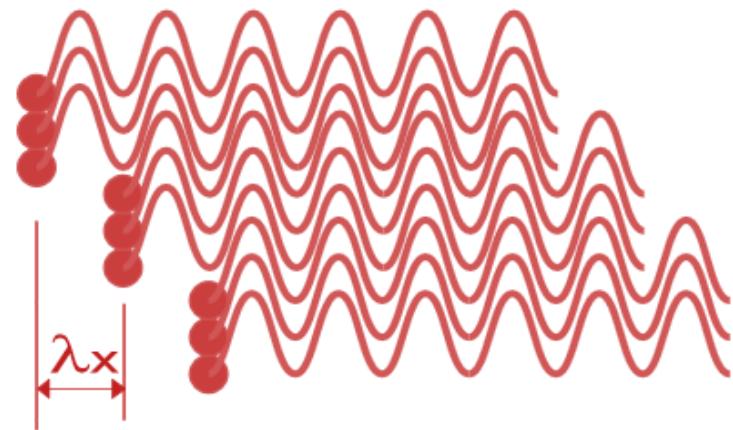

**N -electrons
random distribution**

$$E_{spt} \sim \sqrt{N} E_1$$

$$P_{spt} \sim N P_1$$

FEL: Free Electron Laser

Coherent Radiation

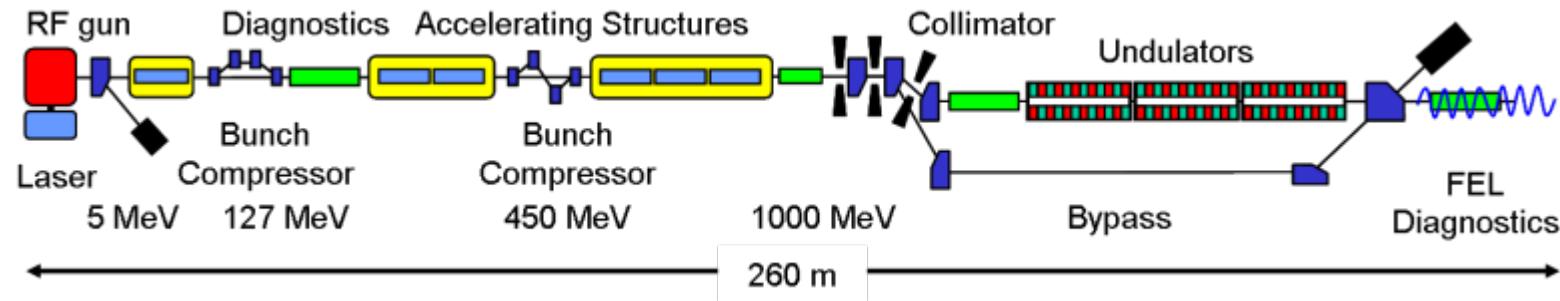

**N -electrons
micro-bunched**

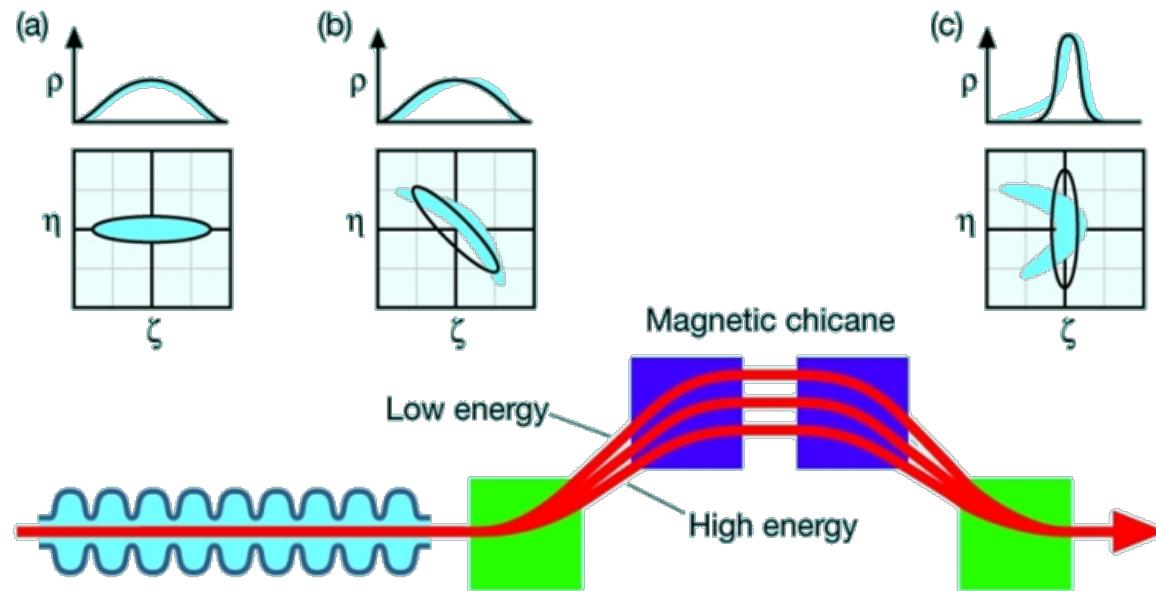

$$E_{coherent} \sim N E_1$$

$$P_{coherent} \sim N^2 P_1$$

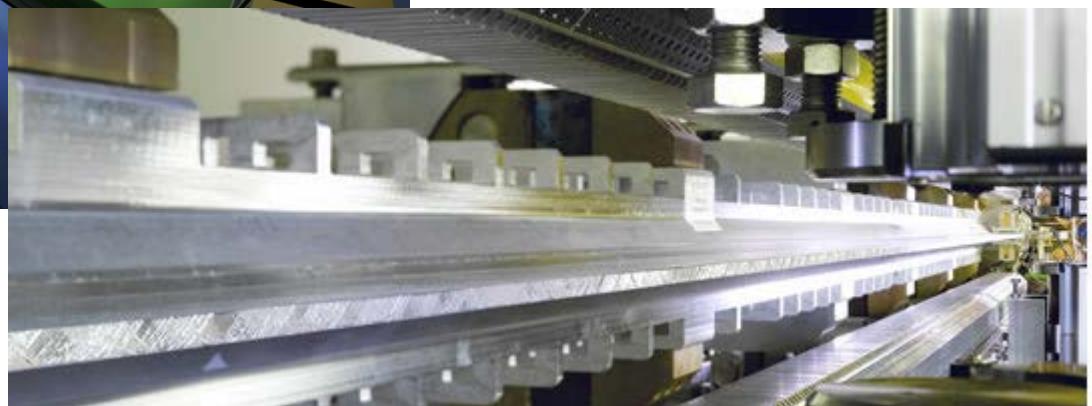

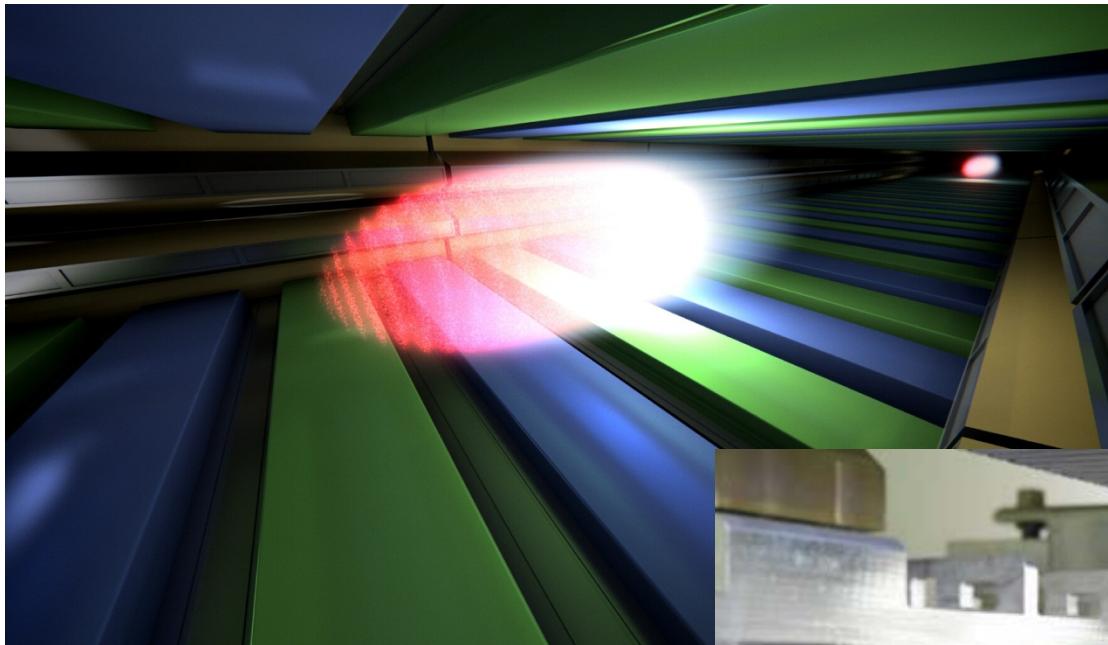

Flash Design layout

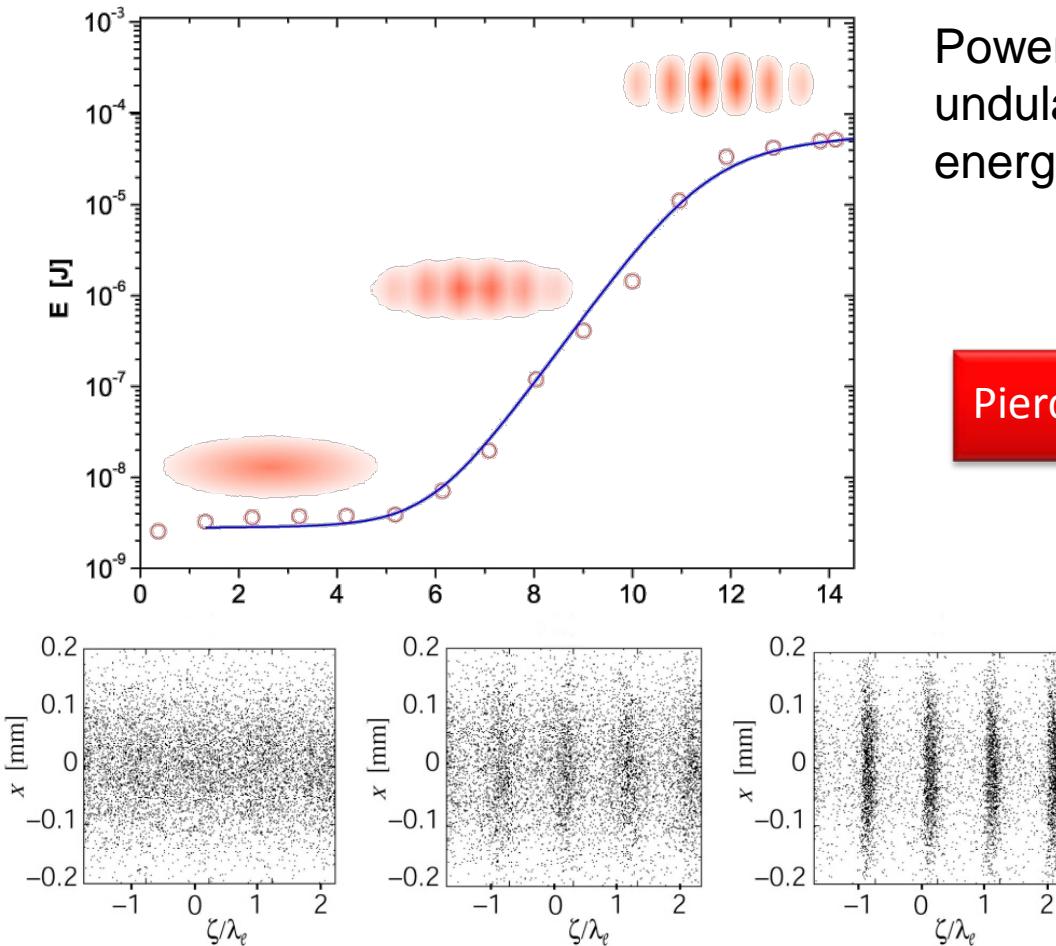

bunch compressor

electron bunch in the undulator

radiation power vs. undulator length

Power grows exponentially with undulator distance z . For a 1-D, mono-energetic beam

$$P \propto e^{\frac{z}{L_{G0}}} \text{ where } L_{G0} = \frac{\lambda_u}{4\sqrt{3\pi\rho}}$$

Pierce Parameter $\rho \sim \frac{\text{radiation power}}{\text{beam power}}$

peak current

$$\rho = \frac{1}{4\gamma_0} \left[\frac{I \lambda_u^2 K^2 [JJ]^2}{I_A \pi^2 \epsilon_x \beta_x} \right]$$

Annotations for the equation:

- A red arrow points to I with the label "17 kA".
- A red arrow points to β_x with the label "beta function".
- A red arrow points to ϵ_x with the label "emittance".

Pierce Parameter

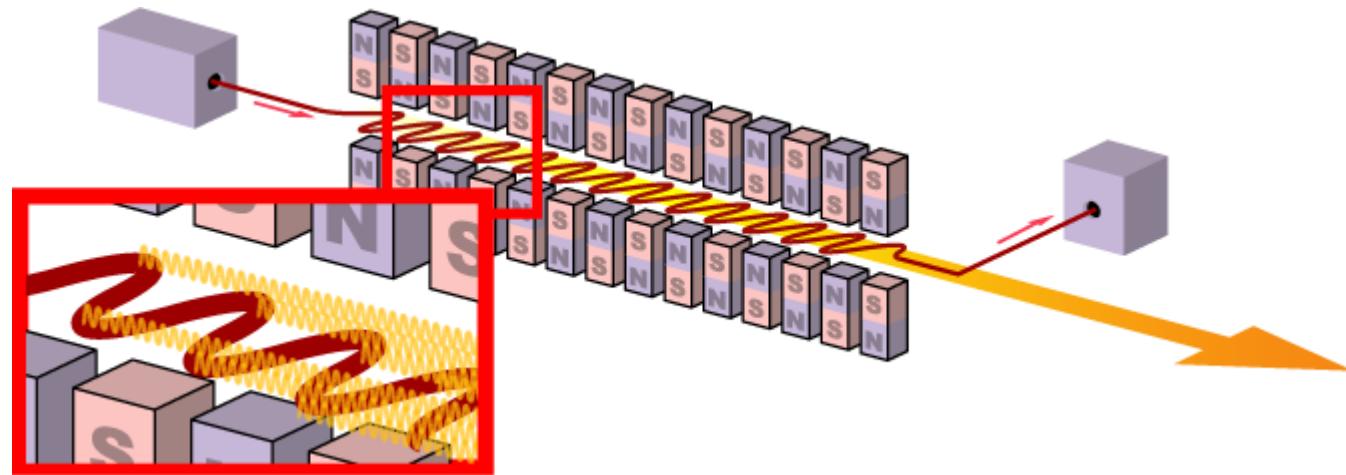

Pierce parameter ρ says how many undulator periods must electrons travel in order to increase FEL power 2e-times

Important FEL parameters are expressed by ρ e.g.

spectrum bandwith $\approx \rho$ $P_{sat} \approx P_{beam} \cdot \rho$

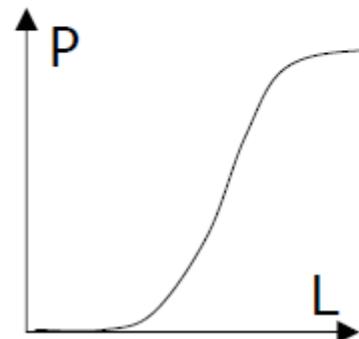

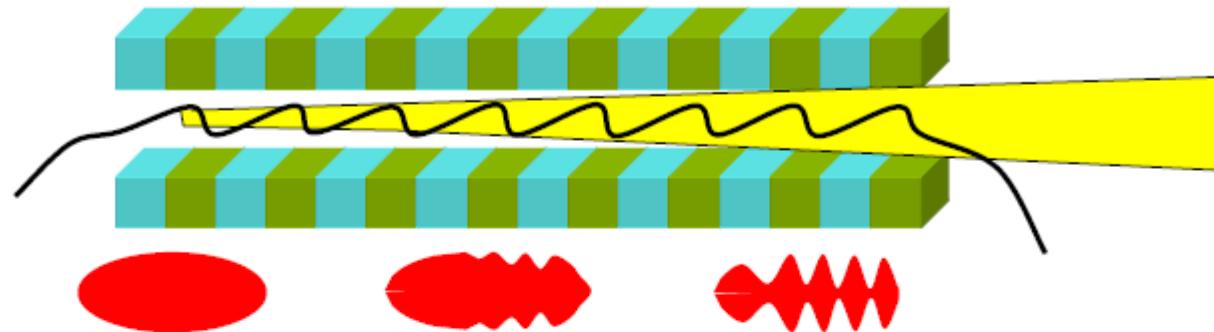

$$\text{Coherence time } \tau_c = \frac{1}{\omega\rho}$$

undulator radiation in a long undulator

Performance of the FEL radiation

2005 – 2007

Wavelength range of the fundamental	13 - 47 nm (from fall 2007: 6.5 nm)
Higher harmonics	3rd 4.6 nm 5th 2.7 nm (7th 1.9 nm)
Average pulse energy	up to 100 μ J
Peak pulse energy	170 μ J
Peak power	5 GW
Average power	100 mW
Pulse duration	10 - 50 fs
Spectral width	0.5 - 1%
Peak brilliance	$10^{29} - 10^{30}$ [photons/(s mrad ² mm ² 0.1% BW)]
